

Cryotherapy (LN2) Aftercare:

If during your office visit your provider uses LN2 to “freeze” a lesion(s) there is nothing that you must do to care for them afterward. It is possible for those areas to blister. This is very common on the hands. If this does occur, wash the area with mild soap and water, apply **Vaseline** or **Aquaphor** and a bandage, repeat this daily until the wound has healed. Please **avoid** using antibiotic ointments such as Neosporin and/or Peroxide, as these can cause allergic reactions/impede wound healing.
